Write, cite, and render with Quarto.

# Chapter 1

## What is Quarto?

Quarto is a publishing system for technical docs. You write a `.qmd` file (Markdown + optional code), and Quarto renders it to **HTML**, **PDF**, slides, and more. By default it renders to **HTML** unless you specify otherwise.

---

# Chapter 2

## Install & verify

- Install Quarto: <https://quarto.org/docs/get-started/>
- Verify in a terminal:

```
quarto check  
quarto --version
```

**PDF note:** PDF output requires a TeX engine. The easiest path is TinyTeX.

```
quarto install tinytex
```

(Or run `mccourse_setup()` in R to install prerequisites automatically.)

---

# Chapter 3

## Your first document

Create `report.qmd`:

```
---
```

```
title: "My Report"
format: html    # default is html if omitted
---  
  
# Hello, Quarto  
  
This is **Markdown**. Add text, lists, images, and code blocks.
```

Render to HTML:

```
quarto render report.qmd --to html
```

---

# Chapter 4

## Course patterns: Documents vs. Book

In this course you'll use Quarto in two modes:

1. **Weekly documents** (one file → one output)
  - Lives under folders like `week_01/`
  - You open a `.qmd` and render it directly
2. **Journal as a Quarto book** (many chapters → one book)
  - Lives in `journal/`
  - Each entry is a chapter in `journal/entries/`
  - The book's table of contents is defined in `journal/_quarto.yml`

### 4.1 Minimal book `_quarto.yml` (`journal`)

```
project:  
  type: book  
  output-dir: _book  
  
book:  
  title: "Course Journal"  
  author: "YOUR NAME"  
  date: today  
  downloads: [pdf, epub]  
  chapters:  
    - index.qmd  
    # --- auto-managed: do not edit below ---  
    # BEGIN AUTO  
    # END AUTO  
    # --- end auto-managed ---  
  
format:  
  html:  
    toc: true
```

```
number-sections: true
pdf:
  toc: true
  number-sections: true
```

The `scripts/update_chapters.R` script rewrites the lines between `BEGIN AUTO` and `END AUTO` to include all dated files under `entries/` (sorted by filename). Don't edit that block manually.

Render the whole journal book from inside `journal/`:

```
quarto render
```

Outputs appear in `journal/_book/`.

---

# Chapter 5

## PDF-first and multi-format options

You can request specific formats in the document YAML:

```
---  
title: "PDF-first example"  
format: pdf  
---
```

Or enable multiple formats with options:

```
---  
title: "PDF & HTML"  
format:  
  pdf:  
    toc: true  
    number-sections: true  
  html:  
    toc: true  
    code-fold: true  
---
```

## Chapter 6

# Render from RStudio or VS Code

- **RStudio:** open a `.qmd` and click **Render**.
  - **VS Code:** install the Quarto extension; use **Quarto: Render** or run `quarto render` in the integrated terminal.
-

# Chapter 7

## Project basics (render only what you intend)

Quarto projects let you render a folder of documents with shared settings and control *which* files render:

```
# site/_quarto.yml (example for a website/docs project)
project:
  type: website
  output-dir: _site
  render:
    - index.qmd
    - pages/**/*.qmd
```

That whitelist prevents Quarto from scanning and rendering the entire repository.

---

# Chapter 8

## Execution control: cache & freeze (optional)

- Cache stores chunk results so long computations aren't re-run.
- Freeze reuses previously rendered results during project renders:

```
execute:  
  freeze: auto
```

Add this to the project's `_quarto.yml` (site or book) to stabilize outputs until sources change.

---

# Chapter 9

## Journal chapter template (prompt-only)

Each journal chapter is created from `entry_template.qmd` and contains **three prompts** plus a **Response** section. Students answer **one** prompt only. The template includes an **automatic word count**:

- **MC 451:** 250–300 words
- **MC 501:** 450–500 words

Rendering the chapter shows the current count and whether it's in range.

New chapters are created by running `source("scripts/new_journal_entry.R")` inside `journal/`. The script injects prompts and updates `_quarto.yml`.

---

# Chapter 10

## Common options

- **Table of contents:** toc: true
  - **Code folding (HTML):** code-fold: true
  - **Section numbering:** number-sections: true
  - **PDF fine-tuning:** geometry, documentclass, keep-tex, include-in-header, etc.
-

# Chapter 11

## Troubleshooting quick hits

- “No TeX installation detected” → run `quarto install tinytex` or `mccourse_setup()`.
- Whole repo renders unintentionally → set `project.render` (see above).
- New journal chapter not appearing → commit both the new `entries/YYYY-MM-DD.qmd` and `journal/_quarto.yml`, then re-render.
- Word count out of range → ensure only the **Response** section contains your text; target the correct range for your course.
